

A new way to heal post-surgery

**Designed to help you look and feel better faster**

## Post-surgical healing:

Internal wound control is essential to healing following tummy tuck, body contouring, breast revision, breast reconstruction and other surgeries. Internal wound control involves reducing open spaces inside the body, and reducing fluid buildup. In the past, various techniques have been used which may be ineffective, cumbersome, messy and cause additional pain for some patients.

“

The IC Surgical Interi System represents a ‘game changer’ for both my patients and my clinical staff. Patient satisfaction, acceptance and comfort are increased.”

– Dr. Lavinia Chong, Newport Beach, CA

## Interi: a new approach to simplify post-surgical recovery

The Interi System from IC Surgical is designed to:

- Gently and continuously reduce the space inside your body where the surgery was done
- Lessen pain during recovery
- Improve post-operative healing and outcomes
- Increase patient convenience with a clean, quiet, simple to use system

## Why does my surgeon use Interi?

**Your surgeon uses Interi to reduce the risk of complications caused by poor internal healing.** When tissue inside the body is disrupted during surgery, fluid build-up inside the open space is called a seroma. Seromas interfere with healing and have been linked to up to 40% of post-surgical complications such as: infections, scar tissue, longer recovery time and needing additional procedures like fluid aspiration.

**Interi also simplifies your post-surgical care.** There are minimal steps to follow, and less patient interaction required, compared to other methods. Bodily fluid is contained in the Therapy Unit and discarded without patient contact or hassle.

**Interi is a closed system, and is easy to use compared to standard bulbs.**

**Many patients feel better after surgery when using Interi.**

## What is Interi therapy?

Interi therapy is delivered by a complete system for internal wound control. Other approaches only offer a partial solution to post-surgical healing. The goals of using Interi are:

- Reduce the internal open spaces
- Remove excess fluid linked to post-surgical complications
- Enhance wound control inside the body
- Provide a quiet, clean, unobtrusive system

**Interi comes with a carry case which can be worn as a fanny pack or messenger bag-style for hassle-free recovery.**
